CRYOTHERAPY COLD THERAPY

CRYOTHERAPY COLD THERAPY

Cryotherapy, or the therapeutic use of extremely low temperatures, is used in sports medicine, rehabilitation to eliminate pain, reduce swelling and relax muscles, and veterinary medicine.

Cryo7 by Wontech uses the action of cold air, the temperature of which is up to -30°C. The air is applied directly to the skin, thanks to which we achieve deeper penetration and better effectiveness of the therapy in comparison with home methods of cold treatment, such as: ice packs, baths or cooling sprays. Using Cryo7 by Wontech does not require operating costs.

MECHANISM OF ACTION

In the first phase of the effect of very low temperatures on the body, peripheral blood vessels and muscles contract and blood flow and metabolism slow down. In the second phase, a defensive reaction occurs, consisting of a rapid dilation of blood vessels and an increase in blood flow. This causes a better supply of nutrients and oxygen and anti-inflammatory mediators to the cells. Thanks to this, we obtain an analgesic effect and accelerate tissue regeneration. The muscles relax and the nervous and immune systems are stimulated.

MOST COMMON INDICATIONS

- Pain
- Inflammation
- Increased muscle tension
- · Sports injuries
- Postoperative conditions
- Rheumatoid arthritis

FEATURES

- Temperature -30°C
- 1200 1/min air flow
- 6 levels of air intensity
- 8.5" touch screen
- Modern look
- Quiet operation
- Mobile and easy to use

TECHNICAL PARAMETERS

MODEL	CRYO7
Screen	8.5" touch screen
Air flow	350-1200 1/min
Air temperature	do-30° C
Dimensions	865×419×854 mm
Weight	85 kg
Power supply	230 V AC, 50-60 Hz/115 V AC, 50-60 Hz
Standard accessories	Treatment pipe with ends: 2 m
